FROSTY POD ROT

Disease of cocoa

Frosty Pod Rot is a disease caused by the fungus *Moniliophthora roreri*. It invades growing cocoa pods damaging them and the seeds produced.

Have you seen these symptoms on cocoa?

- Young pods show light yellow swellings and sometimes distortion. Seed mass may become soft and watery.
- Older pods show large dead tissue, dark brown spots with uneven borders. Premature ripening may occur and seeds become reddish brown.
- As the disease develops most of the dead outside tissue is covered by a thick white fungal growth.

If you suspect you have this disease – immediately call:
